

Booking Confirmation Step

1. Overview

A **Confirmation** step should be configured within the **Approval stage** to display the complete booking information to the **Customer** persona.

The purpose of this step is to allow the customer to review all booking details before making the final confirmation.

2. Booking Information Display

The confirmation interface should present the booking information in a clear and structured format.

The following details should be displayed:

Field	Description
Movie Name	Name of the movie selected by the customer.
Show Timing	Selected show date and time.
Number of Tickets	Total number of tickets requested.
Total Cost	Calculated cost of all requested tickets.

3. Customer Review

The **Customer** persona should be able to review the displayed information before confirming the booking.

The information should be presented in an easy-to-understand format so that the customer can verify:

- The correct **movie** has been selected.
- The correct **show timing** has been selected.
- The requested **number of tickets** is correct.
- The **Total Cost** is accurate.

4. Confirmation Decision

After reviewing the booking information, the customer can make the final decision using the **Booking Status** property.

Confirm Booking

If the customer confirms the details:

Booking Status = Confirmed

The case proceeds to the **Ticket Processing** stage.

Cancel Booking

If the customer does not want to proceed:

Booking Status = Cancelled

The case is resolved without further ticket-processing action.

5. Expected Outcome

The Confirmation step provides the customer with complete visibility of the booking before the final decision is made. This improves transparency, reduces booking errors, and ensures that ticket processing occurs only after customer confirmation.

Confirmation Flow:

Display Booking Details → Customer Reviews Information → Confirm / Cancel → Continue or Resolve Case
