

Show Availability Verification

1. Overview

A **System or Booking Agent** should be able to verify the availability of a selected movie show before proceeding with the ticket booking. This ensures that seats are available for the requested show and prevents customers from booking unavailable seats.

2. Availability Verification

After the customer submits the **Movie Ticket Request**, the system or booking agent checks the selected **Movie**, **Show Date**, **Show Time**, and **Number of Tickets** against the available show information.

The system should verify:

- Whether the selected **movie** is available.
- Whether the requested **show date** is valid.
- Whether the requested **show time** is available.
- Whether enough **seats/tickets** are available.
- Whether the requested number of tickets can be booked.

3. Availability Decision

The system can provide two possible outcomes:

Available

If sufficient seats are available, the booking request can proceed to the next stage of the booking process.

Flow:

Check Show → Seats Available → Approve Availability → Continue Booking

Not Available

If the requested number of seats is not available, the booking should not proceed. The customer or booking agent should be informed that the selected show does not have sufficient seats.

Flow:

Check Show → Seats Not Available → Notify Customer → Select Another Show

4. Expected Outcome

The **Show Availability Verification** stage ensures that tickets are booked only when sufficient seats are available. It helps avoid overbooking and provides a reliable and consistent movie ticket booking experience.
