

Reusable Movie and Show Data Objects

1. Overview

Reusable data objects named **Movie** and **Show** should be created to manage movie and show information independently from the **Movie Ticket Request** case.

Using reusable data objects helps maintain consistent information across multiple booking requests and allows the same movie and show information to be reused throughout the application.

2. Movie Data Object

The **Movie** data object stores information related to movies.

Movie Properties

Property	Description
Movie Name	Name of the movie.
Genre	Category or type of the movie, such as Action, Comedy, Drama, or Thriller.

The Movie data object can be maintained separately and reused whenever a movie needs to be selected during the booking process.

3. Show Data Object

The **Show** data object stores information about movie show schedules and seating capacity.

Show Properties

Property	Description
Movie Name	Movie associated with the show.
Show Date	Date on which the movie show is scheduled.
Show Time	Time at which the show starts.
Seat Capacity	Total number of seats available for the show.

The Show data object allows the system to maintain valid show schedules and determine whether sufficient seats are available for a booking request.

4. Association with Movie Ticket Request

The **Movie** and **Show** data objects should be associated with the **Movie Ticket Request** case type.

During the booking process:

Movie Data → Movie Selection

Show Data → Date, Time & Seat Availability

Movie + Show Data → Movie Ticket Request

This association allows the case to retrieve consistent movie and show information instead of storing duplicate information in every booking case.

5. Benefits of Reusable Data Objects

Using reusable **Movie** and **Show** data objects provides the following benefits:

- **Consistency** – The same movie and show information is used across booking requests.
- **Reusability** – Data can be reused by multiple cases and processes.
- **Maintainability** – Movie and show information can be managed independently.
- **Accuracy** – Customers can select valid movie and show information.
- **Scalability** – New movies and shows can be added without redesigning the case type.

6. Expected Outcome

After configuration, the **Movie Ticket Request** case can use the reusable **Movie** and **Show** data objects to provide accurate movie details, show schedules, and seat capacity.

Overall Relationship:

Movie Data Object + Show Data Object → Movie Ticket Request → Booking Process

This design ensures that movie and show information remains consistent and reusable across multiple booking requests.
