

Movie Ticket Request – Case Type

1. Overview

A case type named **Movie Ticket Request** is created to represent the complete movie ticket booking process. The case manages the booking request from the time the customer provides the required details until the request is processed.

2. Initial Stage – Booking Request

An initial stage named **Booking Request** is created within the **Movie Ticket Request** case type. This stage collects the required information from the customer before the booking request is submitted.

The **Customer persona** should be able to enter the following details:

- **Movie Name** – Name of the movie the customer wants to watch.
- **Show Date** – Date on which the customer wants to watch the movie.
- **Show Time** – Preferred show time.
- **Number of Tickets** – Number of tickets required by the customer.

3. Input Validation

The booking information should be validated before the customer submits the request.

The following validations can be applied:

Field	Validation
Movie Name	Must be selected or entered and cannot be empty.
Show Date	Must be a valid date and should not be in the past.
Show Time	Must be a valid available show time.
Number of Tickets	Must be a valid positive number and within the allowed ticket limit.

If any required information is missing or invalid, the customer should receive an appropriate validation message and should not be able to submit the request until the information is corrected.

4. Reusable Data Objects

The **Movie Ticket Request** case should be associated with reusable data objects named **Movie** and **Show**.

Movie Data Object

The **Movie** data object stores information about available movies. It can contain details such as:

- Movie Name
- Movie ID
- Genre
- Language
- Duration
- Rating

The Movie data object can be reused by different case types or applications that require movie information.

Show Data Object

The **Show** data object stores information about available movie shows. It can contain:

- Show ID
- Movie Name
- Show Date
- Show Time
- Theatre
- Screen
- Available Seats

Using a reusable Show data object helps ensure that customers select valid movie shows instead of manually entering inconsistent information.

5. Case Flow

The basic flow of the **Movie Ticket Request** case is:

Customer → Booking Request → Enter Movie Details → Validate Information → Submit Request → Process Booking

This approach provides a structured booking process and makes the application easier to maintain and extend in the future.

6. Expected Outcome

After completing this configuration, the customer should be able to create a **Movie Ticket Request**, provide the required movie and show information, enter the number of tickets, and submit the request only when all required information passes validation.

The reusable **Movie** and **Show** data objects provide a consistent way to manage movie and show information and can be reused in future stages of the movie ticket booking application.
