

Booking Execution Stage

1. Overview

A **Booking Execution** stage should be added to the **Movie Ticket Request** case to handle the final activities required to complete the movie ticket booking.

This stage is initiated only after the customer confirms the booking. The system performs the required booking activities, allocates seats, generates a ticket identifier, and updates the booking status.

2. Seat Allocation

Within the **Booking Execution** stage, the system should allocate the required number of seats based on the customer's **Number of Tickets**.

The system should:

- Check the available seats for the selected show.
- Allocate the required number of seats.
- Store the allocated **Seat Numbers** in the case.
- Prevent the same seats from being allocated to another booking.

Example

If the customer requests **3 tickets**, the system may allocate:

Seat Numbers: A10, A11, A12

These seat numbers should be recorded in the case for future reference.

3. Booking Properties

The following properties should be maintained within the **Movie Ticket Request** case:

Property	Description
Booking Confirmation Status	Indicates whether the booking has been successfully completed.
Seat Numbers	Stores the seats allocated to the customer.
Ticket ID	Unique identifier generated for the completed booking.

4. Update Booking Status

After successful seat allocation, the system should update the **Booking Confirmation Status**.

Possible values include:

- **Confirmed** – Booking has been successfully completed.
- **Failed** – Booking could not be completed due to an issue such as unavailable seats.

If the booking is successful, the case should contain the allocated seats and generated Ticket ID.

5. Ticket ID Generation

After the seats are successfully allocated, the system should generate a unique **Ticket ID** for the booking.

For example:

Ticket ID: MTB-2026-00125

The Ticket ID can be used to identify and track the booking throughout its lifecycle.

6. Booking Execution Flow

The overall process within this stage is:

Customer Confirmation → Check Seat Availability → Allocate Seats → Generate Ticket ID → Update Booking Status → Complete Booking

If sufficient seats are unavailable, the booking should not be completed and the case should be handled according to the defined exception process.

7. Expected Outcome

After successful execution, the **Movie Ticket Request** case should contain:

- **Movie Name**
- **Show Date and Time**
- **Number of Tickets**
- **Total Cost**
- **Booking Confirmation Status**
- **Seat Numbers**
- **Ticket ID**

This ensures that the completed booking is properly recorded and can be tracked or referenced later.

Final Booking Flow

Movie Ticket Request → Booking Request → Availability → Calculate Booking Cost → Customer Approval → Booking Execution → Ticket Confirmed
