

Approval Stage – Customer Confirmation

1. Overview

An **Approval** stage should be introduced in the **Movie Ticket Request** case to obtain confirmation from the customer before the booking is processed.

This stage ensures that the customer reviews the booking details and confirms whether they want to proceed with the ticket booking.

2. Customer Confirmation Step

A step named **Customer Confirmation** should be configured within the Approval stage.

The step should be assigned to the **Customer** persona. The customer should be able to review important booking information, including:

- **Movie Name**
- **Show Date**
- **Show Time**
- **Number of Tickets**
- **Ticket Price**
- **Total Cost**

The customer then provides a decision using the **Booking Status** property.

3. Booking Status

The **Booking Status** property can contain the following options:

- **Confirmed** – Customer agrees to proceed with the booking.
- **Cancelled** – Customer does not want to proceed with the booking.

4. Approval Decision

The case should follow different paths based on the customer's decision.

Confirmed

If the customer selects **Confirmed**, the case should proceed to the **Ticket Processing** stage.

Flow:

Customer Confirmation → Booking Status = Confirmed → Ticket Processing

Cancelled

If the customer selects **Cancelled**, the booking request should be resolved appropriately. No further ticket-processing action should be performed.

Flow:

Customer Confirmation → Booking Status = Cancelled → Resolve Case

5. Expected Outcome

The Approval stage ensures that tickets are processed only after receiving explicit confirmation from the customer. Confirmed requests continue through the booking process, while cancelled requests are closed without further processing.

Overall Flow:

Availability → Calculate Booking Cost → Customer Approval → Confirmed → Ticket Processing

OR

Availability → Calculate Booking Cost → Customer Approval → Cancelled → Case Resolved
